CC 2: Create an EC2 Instance and Integrate PuTTYgen with Running Instance

1. Open [AWS Console](https://aws.amazon.com/console/?utm_source=chatgpt.com) and login.

2. Go to Amazon EC2 → Click `Launch Instance`.

3. Enter Instance Name.

4. Select:

* Ubuntu Server
* `t2.micro` instance type

5. Create a new Key Pair:

* Key Pair Type = `RSA`
* Private Key Format = `.pem`
* Download the key file.

6. Configure Security Group:

* Allow SSH Traffic
* Port = `22`
* Source = `Anywhere`

7. Click `Launch Instance`.

8. Wait until Instance State becomes `Running`.

9. Copy the `Public IPv4 Address` of the instance.

PuTTYgen Integration Steps

10. Install PuTTY and PuTTYgen from:

[PuTTY Download](https://www.putty.org/?utm_source=chatgpt.com)

11. Open `PuTTYgen`.

12. Click `Load` → Select downloaded `.pem` file.

13. PuTTYgen automatically converts the PEM key.

14. Click `Save private key`.

15. Save the file in `.ppk` format.

Connect EC2 Instance Using PuTTY

16. Open `PuTTY`.

17. In Session:

* Host Name = `ubuntu@<Public-IP>`
* Port = `22`
* Connection Type = `SSH`

18. Go to:

`Connection → SSH → Auth → Credentials`

19. Browse and select the generated `.ppk` file.

20. Click `Open`.

21. Connection successful if terminal shows:

```bash
ubuntu@ip-xxx-xx-x-xxx:~$
```

22. Run Linux Commands:

```bash
pwd
ls
mkdir demo
cd demo
touch file.txt
echo "Hello AWS" > file.txt
cat file.txt
```

23. Exit using:

```bash
exit
```

Viva Conclusion

```text
Created an AWS EC2 Ubuntu instance,
```

configured user authentication using RSA key pair,

converted PEM key into PPK format using PuTTYgen,

and successfully connected the EC2 instance through PuTTY SSH client.

```
```
