

Salesforce Apex — Factorial Calculation

Cloud Computing Lab | LP-II

AIM

To create an application in Salesforce.com using Apex Programming Language to implement Factorial Calculation.

STEPS TO PERFORM

Step 1	Login to Salesforce: Go to https://login.salesforce.com and login with credentials.
Step 2	Open Developer Console: Click Gear icon (top right) → Select 'Developer Console'.
Step 3	Create New Apex Class: In Developer Console → Click File → New → Apex Class → Enter class name 'FactorialCalculation' → Click OK.
Step 4	Write Class Code: Write the Apex class code with factorial method in the editor (see Class Code below).
Step 5	Save the Class: Press Ctrl+S to save the Apex class.
Step 6	Open Anonymous Window: Click Debug → Open Execute Anonymous Window.
Step 7	Write Object & Call Code: Create object and call the factorial method (see Execute Code below).
Step 8	Execute & View Output: Click 'Execute' → Open Logs tab → Click latest log → Check DEBUG output.

APEX CLASS CODE (File -> New -> Apex Class)

```
public class FactorialCalculation {  
  
    // Method to calculate factorial  
    public Integer factorial(Integer n) {  
        Integer result = 1;  
        for(Integer i = 1; i <= n; i++) {  
            result = result * i;  
        }  
        return result;  
    }  
  
}
```

EXECUTE ANONYMOUS CODE (Debug -> Open Execute Anonymous Window)

```
// Create object of FactorialCalculation class
FactorialCalculation obj = new FactorialCalculation();

// Call factorial method using object
Integer num = 5;
Integer result = obj.factorial(num);

// Display output in debug log
System.debug('Factorial of ' + num + ' = ' + result);
```

OUTPUT

DEBUG | Factorial of 5 = 120

CONCLUSION

Successfully created an Apex Class 'FactorialCalculation' in Salesforce Developer Console, created an object of the class, called the factorial method and verified the output. Factorial of 5 = 120.
