

Amazon EC2 Instance Setup Guide

Phase 1: Creating the EC2 Instance

Step 1: Sign in to the AWS Management Console and select the EC2 service [cite: 2-4].

Step 2: Click the Launch Instance button [cite: 6].

Step 3: Choose an Amazon Machine Image (AMI), such as Amazon Linux AMI 2018.03.0 (HVM) [cite: 72-73, 87].

Step 4: Select the t2.micro instance type and click Next [cite: 115, 130].

Step 5: Configure instance details: set number of instances to 1, use the default VPC, and set shutdown behavior to Stop [cite: 191-237].

Step 6: Add Storage by choosing Magnetic (standard) for the volume type and ensuring Delete on termination is checked [cite: 253-285].

Step 7: Add tags for identification, such as Name and Department [cite: 299-318].

Step 8: Configure a Security Group with rules for SSH (port 22), HTTP (port 80), and HTTPS (port 443) [cite: 319-364].

Step 9: Click Review and Launch, then Launch. Create and download a new key pair (.pem file) [cite: 372-431].

Phase 2: Connecting via PuTTY (Windows)

Step 10: Open PuTTYgen, load your .pem file, and click Save private key to create a .ppk file [cite: 560-629].

Step 11: Open PuTTY, enter ec2-user@ followed by your Instance IP in the Host Name field [cite: 630-633].

Step 12: Navigate to Connection > SSH > Auth, browse for your .ppk file, and click Open [cite: 634-637].

Phase 3: Setting up the Web Server

Step 13: Run `sudo su` to get root privileges, then run `yum update -y` to update the instance [cite: 639-640].

Step 14: Install Apache using the command `yum install httpd -y` [cite: 641].

Step 15: Navigate to the web directory with `cd /var/www/html` [cite: 642].

Step 16: Create your web page by running `nano index.html`, entering your HTML code, and saving [cite: 644-646].

Step 17: Start the Apache server with `service httpd start` [cite: 647].

Step 18: Paste the instance's IP address into a web browser to verify the site is live [cite: 648-649].
