

Google App Engine Launcher Setup

Phase 1: Installation & Configuration

Step 1: Install Python 2.7

Download and install Python 2.7. This specific version is required for the classic GAE Launcher to function correctly.

Step 2: Install Google App Engine SDK

Run the installer for the Google App Engine SDK for Python.

Step 3: Set Preferences

Open the Launcher, go to **Edit > Preferences**. Set the "Python Path" to your python.exe (e.g., C:\Python27\python.exe) and the "App Engine SDK" path to the installed SDK folder.

Phase 2: Project Creation

Step 4: Prepare Project Folder

Create an empty folder on your desktop or directory. This will hold your application files like main.py and app.yaml.

Step 5: New Application in Launcher

In the Launcher, go to **File > New Application**. Enter an Application Name and browse to select the empty folder you just created.

Step 6: Verify Port & Runtime

Ensure the runtime is set to Python 2.7 and the port is set to 8080 (default for local testing). Click Create.

Phase 3: Execution & Testing

Step 7: Run the Application

Select your project from the list and click the **Run** button. Wait for the status light to turn green.

Step 8: Browse Locally

Click the **Browse** button or navigate to **http://localhost:8080** in your web browser to view your "Hello World" app.

Step 9: Check Logs

Use the **Logs** button in the Launcher to view the terminal output for debugging and verifying requests.
